

Auto Trading with Diagnostic Tracking

- User Guide

Overview

This guide explains how to run the auto-trading system with comprehensive diagnostic tracking that helps debug issues and provides detailed logs for troubleshooting.

Starting Auto Trading

Basic Commands

```
# Start auto trading with your balance
auto_trade 2.47btc long      # If you have BTC and want to trade
                             long
auto_trade 234462usd short   # If you have USD and want to trade
                             short

# Check status
status                      # Quick position summary
status long                 # Detailed status with all metrics

# Stop trading
stop_auto_trade
```

What Happens When You Start

1. **Strategy Selection:** Loads `best_strategy.json` configuration
2. **Diagnostic File Creation:** Creates `diagnostics_ADAPTIVE_MULTI_YYYYMMDD_HHMMSS.json`
3. **Position Initialization:** Sets up your starting position (long/short)
4. **Real-time Monitoring:** Begins watching for signals and market changes

Diagnostic System

Automatic Logging

The system automatically creates a JSON diagnostic file that tracks:

- **Session Events:** Start/end times, parameters used

- **Signal Evaluations:** Every trading signal considered and why it was/wasn't executed
- **Trades:** All executed trades with position changes and P&L
- **Market Regime Changes:** When strategy switches between trending/ranging/volatile
- **Position Anomalies:** Unusual situations like entry price $> 1.5x$ current price
- **Errors:** Any exceptions or problems encountered
- **Periodic Snapshots:** System
